To foster growth, every major computer manufacturer encourages employees to increase their skills through career training programs. These afford an excellent opportunity to gain a practical knowledge of today's broad range of computer concepts. The industry is also characterized by a liberal policy towards reimbursing the cost of tuition for employees continuing their formal education at outside institutions.

Salaries in data processing are higher than for most industries and fringe benefits are generally excellent.

In short, if you are looking for an exciting, meaningful career, the data processing industry has the elements which can spell success. The challenges await you.

By DR. GEORGE SCHUSSEL
Manager, Information Systems Division
Brown Engineering
Huntsville, Alabama

computers must eliminate growing information gap

You have just spent four or more years learning how to effectively manipulate information to get answers to problems. The problem might be one in engineering, physics, mathematics, or business administration. You solve the problem by the application of calculus, linear programming, legal concepts, stress analysis, or circuit theory. In most problems the basic data has been given in the text, and you needed to know the theory on how to use that data. Once you leave school, you'll find that most real-world problems are just the other way around. The most difficult part of a problem is to get the basic data. Once you have the basic data, a fairly simple analysis will usually give you a good answer.

It is this unsolved problem of getting data in usable form that has resulted in the tremendous growth of the information systems field. Much of this growth has resulted from the advent of computers with tremendous capabilities for rapidly handling and manipulating information.

The modern scientific community has created a fantastic wealth of information. Over 90% of all scientists who ever lived are alive today, working, creating discoveries and new information. In order to be useful, this information must be selectively disseminated to those who are interested in it, must be stored, and must be retrieved when necessary. This necessity for handling information has created the new field and science of information systems.

Most computer oriented companies are vitally concerned with the handling of information. The fact that the stocks of computer companies are so highly priced (a 60 to 1 price earnings ratio is typical) conveys the market opinion of the growth that these companies expect. IBM, the largest company in the information and computer business, has increased its sales 17 times in the last 15 years while its net income has gone up 20 times.

GROWING SHORTAGE

This tremendous growth has created a severe shortage of qualified people to fill important positions in the information systems business. It has been estimated that there is currently a shortage of over 100,000 programmers in the United Sta-
tes alone. This fact is born out in the market place where the law of supply and demand has pushed the salaries of programmers substantially above those of comparably trained engineers, mathematicians, or physicists. Also, this tremendous shortage of qualified people has made for very rapid advancement opportunities. It is not unusual to find managers with substantial responsibility in the information systems business who are still under 30 years of age.

The information systems business is ever changing. One person can simultaneously be working on an automated system for writing a payroll, be developing a means of storing and rapidly retrieving information or be working on a mathematical model for determining a missile system's effectiveness.

This field requires training and experience in mathematics, computer science, business administration, engineering, behavioral sciences, and the various branches of physics. A broad background is highly useful since a capable analyst might find himself successively performing systems consulting, systems analysis, systems design, programming, training, or computer processing. The results from his efforts could be effective solutions in operations research, medical administration, management systems, resource analysis, transportation, advanced planning, weapons and defense systems, simulation modeling, engineering reliability, vulnerability, personnel, statistics, or logistics.

COMPUTER MANUFACTURERS . . .

Since computers play an integral part in the rapidly burgeoning field of information systems, the graduate engineer may decide to join a computer manufacturer and involve himself in basic computer hardware design and manufacture. Modern computers tend to be modular; that is, one can assemble a computer system from several discrete components, picking the component at each step that suits his own specific needs best. The speed of the central processing unit, the size of the memory, the speed and capacity of tape drives, disc drives or drum memories — these all represent characteristics that must be designed and balanced against needs in the market place.

On the other hand, the engineer may be interested in the "software" end of the business. "Software" refers to programming or the writing of instructions for computers. Many fine programmers have been made out of engineers, and the associated opportunity for systems analysis in business, scientific, and engineering fields can provide a challenging job opportunity for any graduate.

. . . AND USERS

More directly related to engineering information, the graduate engineer may find that he is interested in systems to manipulate information of the general field of information storage and retrieval. Here, he may be designing systems for information storage and retrieval or he might get involved in the actual operation by joining the inquiry staff in an information inquiry center.

The advent of the information inquiry center is a phenomenon of the last decade. A typical such center specializes in one subject area such as parts or reliability information. Questions are directed to the center by diverse users who have need for information. The question is first handled by an inquiry staff specialist who knows how to take a general need for information and re-format it into the form necessary for effective search of the material at his center. He will then initi-

DATA PRODUCTS
8535 Warner Drive
Culver City, California
M. S. Cremer
Directors of Industrial Relations
850 employees
Manufacture of line printers and mass data storage systems.

HONEYWELL INC.
DATA PRODUCTS & SERVICES DIVISION
8611 Balboa Avenue
San Diego, California 92112
Clark C. Carlson
Personnel Representative
250 employees
Developing, engineering, manufacturing, marketing and administrative responsibilities for a family of peripheral computer related products, such as keytapes, disk packs and printer ribbons.

IBM CORPORATION
Armonk, New York 10504
(See Advertisement on Page 26)
H. D. Ridge
Director of Employment and Placement
140,000 employees
Producer of equipment and systems for information processing and control, including electronic data processing systems, typewriters, dictation machines, and other related products.

Technical Careers in data processing

ate a search among various systems which could involve computers or microfilm.

The growth in size and numbers of information centers has been spectacular, primarily because of the explosion of technical knowledge, with 1100 centers now in the U. S. Today, it has become almost axiomatic that companies must search beyond their own inhouse information centers in order to be assured that an awareness of the latest information on a given item or topic is maintained.

To summarize, I can say to any young graduate who wants to go into a field where his salary progression will be fast, where he will have demanding technical responsibilities for designing and integrating man-machine systems, and where he is likely to assume management responsibility at a much younger age than he might expect, information systems is the field for you.

REMINGTON RAND DIVISION
SPERRY RAND CORPORATION
1290 Avenue of the Americas
New York, New York 10019
(See Advertisement on Page 4)
D. L. Shoflick
Personnel Administrator
28,000 employees
Mechanical, electro-mechanical and electronic office machines and information retrieval systems.

SCIENTIFIC DATA SYSTEMS
555 South Aviation Boulevard
El Segundo, California 90400
William V. Kendall
Employment Manager
3,100 employees
Manufacture of general purpose digital computers and computer controlled systems.

UNIVAC DIVISION
SPERRY RAND CORPORATION
P. O. Box 8100
Philadelphia, Pennsylvania 19101
(See Advertisement on Page 4)
W. K. Lowe
Director of Management Selection
27,000 employees
Manufacture of commercial and military computer systems.
